# Project Milestone 1: Site Plan & HTML Skeleton

This first project milestone begins the personal portfolio project. Students plan the site structure and create an HTML foundation that can be expanded with styling, accessibility improvements, JavaScript, and deployment in later milestones.

Plan and scaffold your personal portfolio site.

**1. Site Plan (Wireframe)** A rough wireframe sketch (hand-drawn or digital) showing the layout of each of your 3 pages: Home, Projects/Work, and About/Contact. Include a note on your intended color palette and font choices.

**2. HTML Skeleton**

- Three linked HTML files with correct document structure (`<!DOCTYPE html>`, `<head>`, `<body>`)
- A shared `<nav>` with working relative links between all three pages
- A logical heading hierarchy (h1–h3) on each page
- Placeholder content using semantic elements (`<header>`, `<main>`, `<section>`, `<footer>`, etc.)

No CSS required yet. Focus entirely on structure and meaning.

Submit your **GitHub repo URL** with both the wireframe image and the HTML files visible in the repo

# Project Milestone 2: Styled & Responsive

This project milestone extends the portfolio foundation with visual styling and responsive layout. It moves students from HTML structure toward a more polished site that works across common screen sizes.

Apply CSS to your Milestone 1 skeleton and make it fully responsive. Three deliverables:

**1. Styling**

- A linked CSS file applying your planned color palette and a **Google Font pairing** across all pages
- At least **three selector types** used (type, class, ID)
- A consistent spacing system (aim for multiples of 8px)

**2. Layout**

- **Flexbox or Grid** used for at least one multi-column section
- All pages must be visually organized — no unstyled default browser output

**3. Responsiveness**

- Site must work at **320px (mobile)**, **768px (tablet)**, and **1200px (desktop)**
- At least **two `@media` queries** present
- Test with DevTools device emulation

Submit your updated **GitHub repo URL**. Your site must be live on GitHub Pages.

# Project Milestone 3: Accessible & Designed

This project milestone strengthens the portfolio through accessibility and visual design improvements. Students refine the site so it better supports real users and shows more intentional design choices.

Refine your Milestone 2 project to meet accessibility standards and demonstrate intentional visual design. Three deliverables:

**1. Accessibility**

- Run **WAVE** on all three pages and fix every error
- Document each fix in a short README section (one sentence per fix)
- All text/background color combinations must pass **WCAG AA contrast** (check with WebAIM Contrast Checker)

**2. Visual Design**

- Apply at least **two Gestalt principles** intentionally
- Label them in your README — e.g., 'I used proximity to group my project cards'
- Your color palette must be consistent across all pages

**3. Accessible Form**

- Add a contact form to your About/Contact page

- Must include: proper `<label>` elements, `fieldset`/`legend` where appropriate, and accessible error states

Submit your updated **GitHub repo URL** with the README changes visible.

# Project Milestone 4: JavaScript Added

This project milestone adds JavaScript behavior to the portfolio site. Students use interactivity to make the site feel more dynamic while continuing to attend to usability and accessibility.
